SO'ZBOSHI

Ma'lumki, har qanday jamiyatda texnika taraqqiyoti kundalik turmush tarzidan tortib yuqori avtomatlashgan ishlab chiqarish jarayonlarini bajarishgacha fizika fani qonuniyatlarisiz amalga oshmaydi. Shu nuqtai nazardan olib qaraganda, fizika fanini alohida o'qitish, amaliyotga tatbiq etishga e'tibor berish shu kunning muhim vazifasi hisoblanadi.

Oliy o'quv yurtlariga kirish uchun fizikadan test sinovlari topshirayotgan abituriyentlarning aksariyati bu fandan yetarli ko'rsatkichlarga ega bo'lishi zarurligini ko'p yillik tahlillar tasdiqlaydi. Shunday ekan, fizika ham boshqa fanlar qatori abituriyentning ball to'plashida muhim ahamiyat kasb etadi. Biroq tan olib aytish kerakki, umumiyoq o'rta ta'lim, o'rta maxsus va kasb-hunar ta'limi kollejlarida fizika fanidan test topshiriqlarini bajarishda yordam beradigan to'laqonli va keng qamrovli o'quv metodik manbalar yetishmaydi. Shu sababli ham ushbu qo'llanmada o'quvchilarning bilim darajasi, tafakkur qobiliyati, mantiqiy fikrlash imkoniyatlari, fakt va ma'lumotlarni yaxlit, uzviy va uzluksiz tahlil qilish va fikr-mulohaza yuritish borasidagi faoliyatlarini aniqlashga yordam beruvchi test topshiriqlari keltirildi.

Ushbu qo'llanmada O'zbekiston Respublikasi Davlat test markazi tomonidan 1996–2003-yillarda chop etilgan «Axborotnoma» jurnalidagi fizika faniga tegishli test topshiriqlarining deyarli barchasi qamrab olingan. Qo'llanmada umumiyoq fizika kursidan Davlat ta'lim standarti va o'quv dasturiga mos keladigan testlar yechimlari bilan keltirilgan.

O'quv qo'llanmaga kiritilgan testlarning o'ziga xos va boshqa amaldagi qo'llanmalardan farqli jihatni shundaki, tanlangan testlar to'rtta darajali (sodda, o'rtacha, qiyin, murakkab) bo'lib, bular o'quvchilarning yondashuvlarini xilmassishtirishga, ularning masalalar yechishga bo'lgan intilishlarini kuchaytirishga yordam beradi. O'quvchilarning mantiqiy fikrlashini faollashtirib, nazariy mazmundagi masalalarni amaliyotga tatbiq qilishga o'rgatadi.

Qo'llanmada mexanikaning kinematika va dinamika asoslari, mexanikada saqlanish qonunlari, molekular fizika, termodinamika, elektrodinamika, tebranish va to'lqinlar, geometrik va to'lqin optikasi, kvant optikasi, atom va yadro fizikasiga

doir testlar kiritilgan. Har bir bo'lim va mavzu uchun nazorat test topshiriqlarining yechimlari sodda tarzdagi izohlar bilan berilgan.

Qo'llanma ikki qismdan iborat, uning 1-qismida mexanika va molekular fizikaga doir testlar, 2-qismida esa elektrodinamika, tebranish va to'lqinlar, optika, atom va yadro fizikasiga doir test va masalalar izohli yechimlari bilan keltirilgan.

Masalalarni yechishda o'quvchilar, asosan Xalqaro birliklar sistemasi SI dan foydalanishlari nazarda tutilgan. Tanlangan masalalar hajmi va mazmuni jihatdan xalq xo'jaligining barcha tarmoqlarini qamrab olgan. Hozirgi zamon komputer, axborot-kommunikatsiya, nanotexnologiyalarini fizika fanining yutuqlarisiz tasavvur qilish qiyin. Fizika fanini o'quvchilarga o'rgatish saviyясини ўуқори көтаришда асosiy jarayon, bu – berilgan testlarni qisqa muddatda aniq va to'g'ri yechish hisoblanadi. Shularni nazarga olgan holda bu ishda sizga omad tilaymiz.

- 1) ko'chish; 2) traektoriya; 3) yo'l
A) 1 B) 2 C) 3 D) 1, 2, 3

Moddiy nuqtaning o'z harakati davomida qoldirgan izi **trayektoriya** deb ataladi.

Javob: B) 2

1.2. Jumlaning mazmuniga mos so'zni qo'yib, gapni to'ldiring. Harakati o'rganilayotgan jismning o'lchami va shakli kuzatilayotgan sharoitda hech qanday ahamiyatga ega bo'lmasa, bunday jism deb aytildi.

- A) qattiq jism B) moddiy nuqta
C) elastik jism D) qo'zg'almas jism

Harakati o'rganilayotgan jismning o'lchami va shakli kuzatilayotgan sharoitda hech qanday ahamiyatga ega bo'lmasa, bunday jism **moddiy nuqta** deb aytildi.

Javob: B) moddiy nuqta

1.3. Poyezd Samarqanddan Toshkentga keldi. Bunda lokomotiv bosib o'tgan yo'l bilan oxirgi vagon bosib o'tgan yo'l baravarmi? Ushbu masalada poyezdni moddiy nuqta deb qarash mumkinmi?

- A) ha; mumkin B) yo'q; mumkin emas
C) yo'q; mumkin D) ha; mumkin emas

Lokomotiv va oxirgi vagon bosib o'tgan yo'li teng. Chunki lokomotiv va oxirgi vagon bir paytda bir xil tezlikda harakat boshlaydi va bir paytda to'xtaydi.

Poyezdning o'lchami Samarqanddan Toshkentgacha bo'lgan masofadan juda kichik bo'lganligi uchun uni moddiy nuqta deb qarash mumkin.

Javob: A) ha; mumkin.

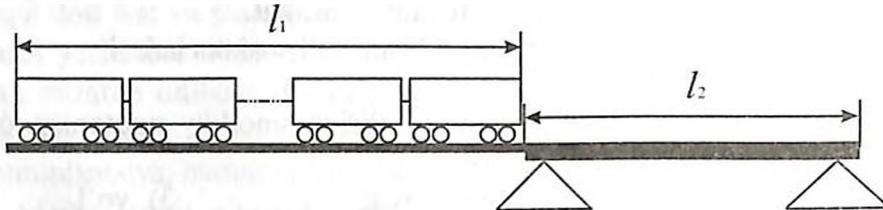

1.4. Uzunligi 450 m ga teng bo'lgan passajir poyezdi 300 m uzunlikdagi ko'prikdan o'tdi. Bunda poyezdning bosib o'tgan yo'li nimaga teng?

- A) 450 m B) 300 m C) 150 m D) 750 m

Berilgan:

$$\begin{array}{l} l_1 = 450 \text{ m} \\ l_2 = 300 \text{ m} \\ \hline S = ? \end{array}$$

Yechilishi: l_1 uzunlikdagi poyezd l_2 uzunlikdagi ko'priidan to'liq o'tib olishi uchun $S = l_1 + l_2$, yo'lni bosib o'tishi kerak.
 $S = 450 + 300 = 750 \text{ m.}$

Javob: D) 750 m.

1.5. Sportchi uzunligi 400 m bo'lgan yugurish yo'lakchasiini 2 marta aylanib chiqib, start berilgan joyga qaytib keldi. Bu harakatda sportchining bosib o'tgan yo'li L (m) va uning ko'chish moduli S (m) nimaga teng?

- | | |
|-----------------------|-----------------------|
| A) $L = 800; S = 400$ | B) $L = 400; S = 800$ |
| C) $L = 800; S = 0$ | D) $L = S = 800$ |

Berilgan:

$$\begin{array}{l} l = 400 \text{ m} \\ n = 2 \\ \hline L = ? \quad S = ? \end{array}$$

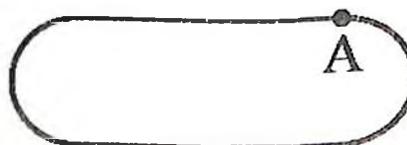

Yechilishi: bu masalada sportchi harakatni A nuqtadan boshlab, yana A nuqtaga yetib kelyapti. Demak, ko'chishi nolga teng:

$$|S| = 0.$$

Sportchi harakati davomida 400 m uzunlikdagi yugurish yo'lkasini n marta aylanib o'tyapti. Umumiy bosib o'tgan yo'l quyidagicha bo'ladi.

$$\begin{aligned} L &= n \cdot l \\ \text{bu yerda } n &= \text{aylanishlar soni.} \\ L &= 2 \cdot 400 = 800 \text{ m.} \end{aligned}$$

Javob: C) $L = 800; S = 0.$

1.6. Jism gorizontga 60° burchak ostida harakatlanib, qiyalik bo'ylab 300 m yurib yuqoriga ko'tarildi. Jismning gorizontal yo'nalishdagi ko'chishini aniqlang (m).

- | | | | |
|-------|--------|--------|--------|
| A) 70 | B) 150 | C) 280 | D) 346 |
|-------|--------|--------|--------|

Berilgan:

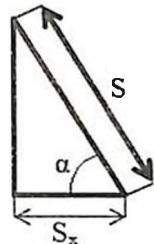

$$\begin{array}{l} \alpha = 60^\circ \\ S_x = 300 \text{ m} \\ \hline S_y = ? \end{array}$$

Yechilishi: jism qiya tekislik bo'ylab harakatlanganda gorizontal va vertikal bo'ylab, boshlang'ich vaziyatga nisbatan ko'chadi. Jismning gorizontal ko'chishini to'g'ri burchakli uch-burchak uchun burchak kosinusini ta'rifiga asosan topamiz, ya'ni

$$\cos \alpha = \frac{S_x}{S} \rightarrow S_x = S \cdot \cos \alpha$$

$$S_x = 300 \cdot \cos 60^\circ = 300 \cdot 0,5 = 150 \text{ m}$$

Javob: B) 150.

1.7. Tennis koptogi 3 m balandlikdan yerga tushdi va yerdan qaytib ko'tarilayotganda, 70 sm balandlikda tutib olindi. Koptokning yo'li va ko'chishi ning modulini toping.

- A) 3 m; 70 sm B) 3,7 m; 2,3 m C) 3,07 m; 2,03 m D) 3 m; 2,3 m

Berilgan:

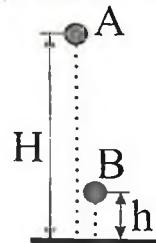

$$H = 3 \text{ m}$$

$$h = 70 \text{ sm} = 0,7 \text{ m}$$

$$L = ? \quad S = ?$$

Yechilishi: jism H balandlikdan pastga tushib, yana qaytib h balandlikka tepaga chiqyapti. Bu holat davomida umumiy bosib o'tilgan masofa

$$L = H + h = 3 + 0,7 = 3,7 \text{ m}$$

Boshlang'ich vaziyatda jism 3 m balandlikda turgan edi va keyin yerga urilib qaytishda yerdan 0,7 m balandlikda ushlab olindi. Bu ikki nuqtalar orasidagi masofa quyidagiga teng.

$$|\bar{S}| = H - h = 3 - 0,7 = 2,3 \text{ m}$$

Javob: B) 3,7 m; 2,3 m

1.8. Velosipedchi to'g'ri yo'l bo'ylab g'arbga tomon 7 km yurdi, so'ngra qaytib sharqqa tomon yana 3 km yo'l yurdi. Velosipedchining yurgan yo'li L(km) va ko'chish moduli S (km) nimaga teng?

A) $L = 10$; $S = 4$ B) $L = 10$; $S = 10$

C) $L = 3$; $S = 4$ D) $L = 4$; $S = 3$

Berilgan:

$$S_1 = 7 \text{ km}$$

$$S_2 = 3 \text{ km}$$

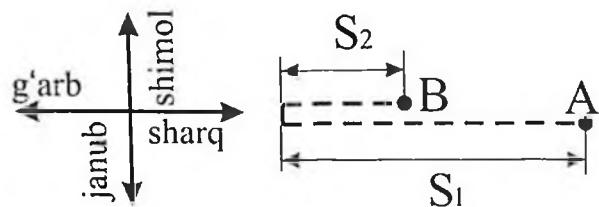

$$L = ? \quad S = ?$$

Yechilishi: bundan keyingi shunga o'xshash masalalarni tasavvur qilish qiyin bo'lmasligi uchun dunyo tomonlariga belgilash kiritamiz.

$$L = S_1 + S_2 = 7 + 3 = 10 \text{ km ga teng.}$$

$$\text{Ko'chishi esa } S = S_1 - S_2 = 4 \text{ km}$$

Javob: A) $L = 10$; $S = 4$

1.9. Qanday harakatda jismning o'tgan yo'li ko'chish moduliga teng bo'ladi?

- A) tekis harakatda B) egrisi chiziqli harakatda
 C) aylanma harakatda D) to'g'ri chiziqli harakatda

Faqat to'g'ri chiziqli harakatda jismning bosib o'tgan yo'li, ko'chish moduliga teng bo'ladi.

Javob: D) to'g'ri chiziqli harakatda

1.10. Qaysi holda jismni moddiy nuqta deb qarash mumkin? 1. Poyezdni ko'priordan o'tishida; 2. Elektronni yadro atrofidagi harakatida; 3. Raketani orbitaga ko'tarilishida.

- A) 2,3 B) 2 C) 3 D) 1,2,3

Harakati o'rganilayotgan jismning o'lchami va shakli kuzatilayotgan sharoitda hech qanday ahamiyatga ega bo'lmasa, bunday jism **moddiy nuqta** deb aytildi.

1) Poyezdning uzunligi ko'prik uzunligiga yaqin bo'lgani uchun, bu holda poyezdni moddiy nuqta deb qarab bo'lmaydi.

2) yadroning o'lchami va massasi elektronning o'lchami va massasidan ancha katta bo'lganligi uchun, elektronni moddiy nuqta deb olish mumkin.

3) Raketening orbitaga ko'tarilguncha bosib o'tgan masofasi uning o'lchamidan ancha katta bo'lganligi uchun, raketani bu yo'lda moddiy nuqta deb qarash mumkin.

Javob: A) 2,3

1.11. Chana gorizont bilan 45° burchak hosil qilgan tepalikda 100 m masofani bosib o'tdi. Chananing vertikal va gorizontal yo'naliishlardagi ko'chishlarini toping (m).

- A) 71; 100 B) 71; 71 C) 100; 7,1 D) 50; 50

Berilgan:

$$\alpha = 45^\circ$$

$$S = 100 \text{ m}$$

$$S_x = ? \quad S_y = ?$$

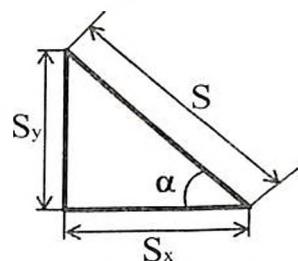

Yechilishi: masalani ishlashda to'g'ri burchakli uchburchak uchun burchak kosinusni va sinusi ifodalaridan foy-dalanamiz:

Burchakka yopishgan katet S_x ning gi patenuza S ganisbati shu burchakning kosinusiga teng.

$$\cos \alpha = \frac{S_x}{S} \Rightarrow S_x = S \cdot \cos \alpha$$

Burchak qarshisidagi katet S_y ning gi patenuza S ga nisbati shu burchakning sinusiga teng.

$$\sin \alpha = \frac{S_y}{S} \Rightarrow S_y = S \cdot \sin \alpha$$

$$S_x = 100 \cdot \cos 45^\circ = 100 \cdot \frac{\sqrt{2}}{2} \approx 71 \text{ m}$$

$$S_y = 100 \cdot \sin 45^\circ = 100 \cdot \frac{\sqrt{2}}{2} \approx 71 \text{ m}$$

Javob: B) 71; 71

1.12. Havo shari qandaydir balandlikka vertikal ko'tarilgach, shamol uni gorizontal yo'nalishda 600 m masofaga uchirib ketdi. Agar havo sharining ko'chishi 1 km bo'lsa, havo sharining o'tgan yo'lini aniqlang (m).

- A) 1400 B) 400 C) 600 D) 1600

Berilgan:

$$l = 600 \text{ m}$$

$$S = 1 \text{ km} = 1000 \text{ m}$$

$$L = ?$$

Yechilishi: havo sharining bosib o'tgan masofasini hisoblab topish uchun, avval havo shari qanday balandlikka ko'tarilganini topish kerak. Buning uchun Pifagor teoremasidan foydalanamiz:

Katetlar kvadratlарининг yig'indisi gipatenuzaning kvadratiga teng.

$$S^2 = l^2 + h^2 \Rightarrow h = \sqrt{S^2 - l^2}$$

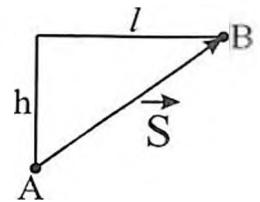

$$h = \sqrt{1000^2 - 600^2} = 800 \text{ m}$$

Havo sharining bosib o'tilgan yo'li L uning vertikal va gorizontal yo'nalishlarda o'tgan masofalari h va l larning yig'indisiga tengdir.

$$L = h + l$$

$$L = 800 + 600 = 1400 \text{ m}$$

Javob: A) 1400.

1.13. Havo shari vertikal yo'nalishda 200 m balandlikka ko'tarilgach, shamol uni gorizontal yo'nalishda 150 m masofaga eltib bordi. Havo sharining o'tgan yo'li (m) va ko'chish modulini (m) toping.

- A) 350; 250 B) 350; 50 C) 350; 200 D) 200; 150

Berilgan:

$$h = 200 \text{ m}$$

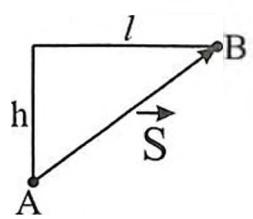

$$l = 150 \text{ m}$$

$$L = ? \quad S = ?$$

Yechilishi: Havo sharining bosib o'tgan yo'li L uning vertikal va gorizontal yo'nalishlarda o'tgan masofalari h va l larning yig'indisiga tengdir. $L = h + l$

$$L = h + l = 150 + 200 = 350 \text{ m}$$

Havo sharining ko'chish modulini Pifagor teoremasidan foydalanib topamiz.

Ya'ni gipatenuza S ning kvadrati katetlar (h va l larning) kvadratlarining yig'indisiga teng.

$$S^2 = l^2 + h^2.$$

$$S = \sqrt{h^2 + l^2} = \sqrt{200^2 + 150^2} = 250 \text{ m}$$

Javob: A) 350; 250

1.14. Sportchi shimol tomon harakatlanib, 5 km masofani bosib o'tgach, sharq tomonga burilib 4 km yurdi. So'ngra janub tomonga burilib, yana 8 km masofani o'tdi. Sportchining o'tgan yo'lini (km) va ko'chish modulini (km) toping.

- A) 17; 4 B) 17; 5 C) 17; 7 D) 9; 8

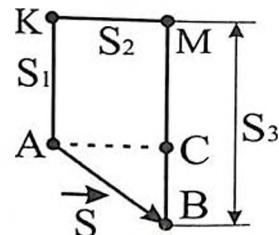

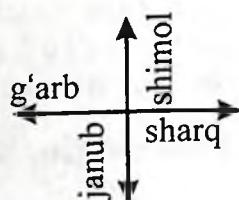

Berilgan:

$$S_1 = 5 \text{ km} = 5000 \text{ m}$$

$$S_2 = 4 \text{ km} = 4000 \text{ m}$$

$$S_3 = 8 \text{ km} = 8000 \text{ m}$$

$$L = ? \quad S = ?$$

Yechilishi: dunyo tomonlarini rasmida ko'rsatilgandek belgilab chizma chizamiz. Bunda yo'l quyidagicha topiladi:

$$L = S_1 + S_2 + S_3 = 5 + 4 + 8 = 17 \text{ km}$$

Ko'chish esa AB oraliqdagi S masofaga teng. AC oraliq S_2 ga teng bo'lsa, BC oraliq ($S_3 - S_1$) ga teng. Demak, S ni Pifagor teoremasiga asosan quyidagicha topamiz:

$$S = \sqrt{S_2^2 + (S_3 - S_1)^2} = \sqrt{4^2 + (8 - 5)^2} = 5 \text{ km}.$$

Javob: B) 17; 5.

1.15. Samolyot avval shimol tomonga 40 km, so'ngra sharq tomonga 30 km masofaga parvoz qildi. Uning ko'chishini toping.

- A) 30 km B) 40 km C) 50 km D) 70 km

Berilgan:

$$S_1 = 40 \text{ km} = 40000 \text{ m}$$

$$S_2 = 30 \text{ km} = 30000 \text{ m}$$

$$S = ?$$

Yechilishi: ko'chishi Pifagor

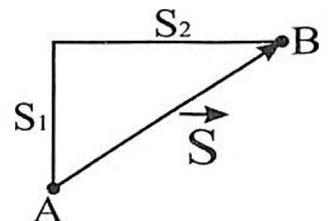

teoremasiga asosan

$$S = \sqrt{S_1^2 + S_2^2}$$

ga teng.

$$S = \sqrt{40000^2 + 30000^2} = 50000 \text{ m} = 50 \text{ km}$$

Javob: C) 50 km

1.16. Jism radiusi 5 m bo‘lgan aylana trayektoriya bo‘ylab o‘zgarmas 8 m/s tezlik bilan harakatlanmoqda. Jismning o‘tgan yo‘li 314 m ga teng bo‘lishi uchun u aylanani necha marta o‘tishi kerak?

A) 10

B) 5

C) 8

D) 6

Berilgan:

$$R = 5 \text{ m}$$

$$v = 8 \text{ m/s}$$

$$S = 314 \text{ m}$$

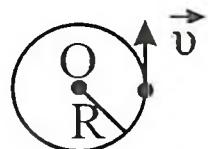

$$\underline{N = ?}$$

Yechilishi: bizga ma’lumki, aylana uzunligi $l = 2\pi R$ ifodadan aniqlanadi. Demak, jism aylanani bir marta aylanganda shu masofani bosib o‘tadi, ya’ni, $S_1 = l$. Agar jism aylanani N marta aylangan bo‘lsa, $S = N \cdot l$ bo‘ladi.

$$N = \frac{S}{l} = \frac{S}{2\pi R} = \frac{314}{2 \cdot 3,14 \cdot 5} = 10$$

N=10 marta aylanishi kerak.

Javob: A) 10.

1.17. Quyidagi hollarning qaysilarida jismлarni moddiy nuqta deb hisoblash mumkin: 1) Yer Quyosh atrofida orbita bo‘ylab harakat qilmoqda; 2) poyezd ko‘prik ustidan o‘tmoqda; 3) tokar stanogida detal yasamoqda; 4) Toshkent-Moskva reysi bo‘yicha samolyot uchmoqda; 5) Yer o‘z o‘qi atrofida aylanmoqda.

A) 1; 5

B) 1; 4

C) 2; 3

D) 3; 4

Harakati o‘rganilayotgan jismning o‘lchami va shakli kuzatilayotgan sharoitda hech qanday ahamiyatga ega bo‘lmasa, bunday jism **moddiy nuqta** deb aytildi.

1) Yer Quyosh atrofida orbita bo‘ylab harakat qilganda, Yerni moddiy nuqta sifatida qarash mumkin. Chunki Yerning o‘lchami uning Quyosh atrofida harakatlanish orbitasining o‘lchamidan hisobga olinmaydigan darajada kichik.

2) poyezd ko‘prik ustidan o‘tyotganda, poyezdni moddiy nuqta sifatida qaray olmaymiz, chunki ko‘prik va poyezd o‘lchamlari deyarli bir xil bo‘ladi.

3) tokar stanogida detal yasayotganda, detalni moddiy nuqta sifatida qaray olmaymiz, chunki bu holatda detalning o‘lchami muhim ahamiyatga ega.

4) Toshkent-Moskva reysi bo‘yicha samolyot uchganda somolyotni moddiy nuqta sifatida qarash mumkin. Chunki somolyotning o‘lchamini Toshkentdan Moskvagacha bo‘lgan masofadan hisobga olmaydigan darajada kichik.

5) Yer o‘z o‘qi atrofida aylanyotganda uni moddiy nuqta sifatida qaray olmaymiz. Chunki ekvatordagi nuqtalarining chiziqli tezligini hisoblashda, yoki ekvator-dagi nuqtalarining markazga intilma tezlanishini hisoblashda Yer radiusi hisobga olinadi.

Javob: B) 1;4.

1.18. Oyning Yer atrofidagi harakatiga bog'liq masalalarda nima uchun Oyni moddiy nuqta deb hisoblash mumkin?

- A) Oy — yerning yo'ldoshi
- B) Oyning radiusi uning orbitasi radiusidan ancha kichik
- C) Oyda atmosfera yo'q
- D) Oy — shar shaklida

Oyning radiusi uning Yer atrofida aylanish orbitasi radiusidan ancha kichik bo'lganligi uchun bu holatda oyni moddiy nuqta sifatida qarash mumkin.

Javob: B) Oyning radiusi uning orbitasi radiusidan ancha kichik

1.19. Ertalab avtobus yo'lga chiqib, kechqurun avtobazadagi o'z o'rniqa qaytib keldi. Shunda hisoblagichning ko'rsatkichi 600 km ga ortdi. Avtobusning yo'li (L) va ko'chish moduli (S) nimaga teng (km)?

- | | |
|---------------------|-----------------------|
| A) $L = S = 600$ | B) $L = 600, S = 300$ |
| C) $L = 600, S = 0$ | D) $L = 0, S = 600$ |

Berilgan:

$$\Delta L = 600 \text{ km}$$

$$L = ? \quad S = ?$$

Yechilishi: avtobusning bosib o'tgan yo'li hisoblagich ko'rsatkichining o'zgarishiga teng bo'ladi. $L = \Delta L = 600 \text{ km}$.

Ko'chishi esa $S = 0$. Chunki harakatning boshi va oxiri bitta nuqtada bo'lyapti.

Javob: C) $L = 600, S = 0$

1.20. Turistlar guruhi avval janub tomonga 12 km, so'ngra shimol tomonga 4 km yo'l yurib to'xtadilar. Guruh necha km masofaga ko'chgan?

- | | | | |
|-------|------|-----------------|-----------------|
| A) 16 | B) 8 | C) $4\sqrt{10}$ | D) $6\sqrt{10}$ |
|-------|------|-----------------|-----------------|

Berilgan:

$$S_1 = 12 \text{ km}$$

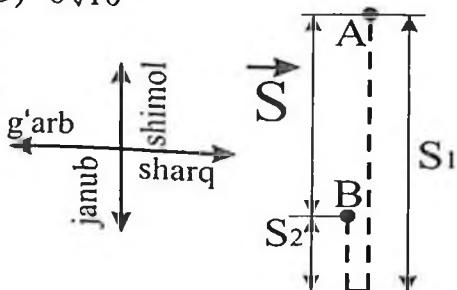

$$S_2 = 4 \text{ km}$$

$$S = ?$$

Yechilishi: dunyo tomonlarini rasmida ko'rsatilgandek belgilab chizma chizamiz. Bunda turistlar g'arb janub shimol sharq g'arb janub shimol sharq

$$S = S_1 - S_2 = 12 - 4 = 8 \text{ km}$$

ga teng.

Javob: B) $S = 8 \text{ km}$.

1.21. Qo'l soati sekund milining uzunligi 1 sm ga teng. Bir soat davomida sekund mili uchidagi nuqtaning o'tgan yo'li qanchaga (m) teng bo'ladi?

Yechilishi: Avtomobil tormozlana boshlagan paytda tezligi v_0 edi va butunlay to'xtab bo'lguncha tekis sekinlanuvchan harakat qiladi va harakat oxirida avtomobilning tezligi $v = 0$ bo'ladi.

Tekis o'zgaruvchan harakatda jismning bosib o'tgan yo'li quyidagicha topiladi:

$$S = v_{o'rt} \cdot t \quad (1)$$

Tekis o'zgaruvchan harakatda o'rtacha tezlikni topish uchun quyidagi ifoda doim o'rinni:

Bu ifodadan foydalanib (1) ifodani quyidagicha yozishimiz mumkin:

$$S = \frac{v + v_0}{2} \cdot t \quad (3)$$

Biz qarayotgan masala tekis sekinlanuvchan harakat va harakat oxiridagi tezlik $v = 0$ bo'lgani uchun (3) ifodani quyidagicha ifodalaymiz va avtomobilning tormozlanish masofasini topamiz:

$$v_1 = 20 \text{ m/s}$$

$$a_2 = 0,4 \text{ m/s}^2$$

$$t = ?$$

Yechilishi: Ikkinci avtomobil birinchisini quvib yetishi uchun ikkinchi avtomobil birinchi avtomobilning bosib o'tgan yo'llini bosib o'tishi kerak, ya'ni 1-va 2-avtomobillarning bosib o'tgan yo'llari teng bo'lishi kerak $S_1 = S_2$.

Birinchi avtomobil v_1 tezlik bilan tekis harakat qilyapti, shuning uchun uning bosib o'tgan yo'li quyidagicha:

Ikkinci avtomobil boshlang'ich tezliksiz a tezlanish bilan tekis tezlanuvchan harakat qilyapti, shuning uchun uning bosib o'tgan yo'li quyidagicha:

$$S_2 = \frac{at^2}{2} \quad (2)$$

Shartga ko'ra (1) va (2) ifodalarni tenglashtiramiz va 2-avtomobil 1-avtomobilni qancha vaqt da quvib yetganini topamiz:

$$v_1 t = \frac{at^2}{2} \Rightarrow t = \frac{2v_1}{a} = \frac{2 \cdot 20}{0,4} = 100 \text{ s}$$

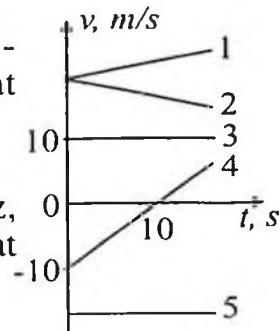

Javob: A) 100.

Tekis tezlanuvchan harakatda jism tezligi bir xil vaqt oraliq'ida bir xil kattaliklarga ortib borishi kerak. Bunday ko'rinishni 1 va 4 harakat grafiklarida ko'rish mumkin.

- A) 80 B) 60 C) 40 D) 20

Masalani grafik orqali yechamiz: tormozlanish jism tezligining tekis kamayishi bilan boshlanadi, (garafikka qarang). Avtomobilning tormozlanish yo'li uning harakatlanish vaqtining 4-sekundidan 8-sekundigacha davom etgan. Avtomobil 1- sekunddan 4-sekundgacha esa tekis harakat qilgan. Bizdan avtomobilning tormozlanish masofasi so'rallyapti, ya'ni avtomobil harakat vaqtining 4-sekundidan 8-sekundigacha bosib o'tgan masofasi. Ma'lumki, jism tezligining vaqtga bog'lanish grafigida hosil bo'lgan yuza jismning bosib o'tgan yo'liga teng. Shuning uchun, biz avtomobil harakat vaqtining 4-sekundidan 8-sekundigacha harakatlanganida hosil bo'lgan grafik yuzasini topib qo'yamiz, ya'ni to'g'ri burchakli uchburchakning yuzasi:

$$S = \frac{ab}{2} = \frac{4 \cdot 20}{2} = 40 \text{ m}$$

Javob: C) 40 m.

$$\begin{aligned} v_0 &= 20 \text{ m/s} \\ t &= 2 \text{ s} \\ a &=? \end{aligned}$$

Yechilishi: Tezlanish, bu — jism tezligining vaqt birligi ichida o'zgarishidir:

$$a = \frac{v - v_0}{t} \quad (1)$$

Avtomobil tormozlana boshlaganda tezligi v_0 edi, to'xtaganda esa $v = 0$ bo'ladi, bundan foydalanib (1) formulani quyidagicha yozamiz:

$$a = \frac{-v_0}{t} \quad (2)$$

Biz avtomobil tezlanishining modul qiymatini topayotganimiz bois (2) ifodaning, modul qiymatini quyidagicha yozamiz va avtomobil tezlanishining modul qiymatini topamiz:

$$a = \left| \frac{-v_0}{t} \right| = \frac{v_0}{t} = \frac{20}{2} = 10 \text{ m/s}^2$$

Javob: B) 10.

- A) 2 B) o'zgarmaydi C) 5 D) 3

Berilgan: $\frac{v = 10 - 2t}{t = ?}$ **Yechilishi:** Tezlik vektori avval nolga teng bo'ladi, undan so'ng harakat yo'nalishi, ya'ni tezlik vektori qarama-qarshi tomonga o'zgaradi:

$$10 - 2t = 0 \Rightarrow t = 5s$$

Demak, jism 5 sekunddan keyin o'z harakat yo'nalishini qarama-qarshisiga o'zgartirar ekan!

Javob: C) 5.

6.10. Jismning boshlang'ich tezligi 10 m/s, tezlanishi esa 2 m/s² bo'lsa, jism tezligini ikki marta orttirishi uchun qancha masofani bosib o'tishi kerak bo'la-di (m)?

$$a = 2s$$

$$v = 2v_0 = 20 \text{ m/s}$$

$$S = ?$$

Yechilishi: Tekis o'zgaruvchan harakatda jismning bosib o'tgan yo'li quyidagicha topiladi:

$$S = v_{o'n} \cdot t \quad (1)$$

Tekis o'zgaruvchan harakatda o'rtacha tezlikni topish uchun quyidagi ifoda har doim o'rinni:

Jismning n -sekundda bosib o'tgan yo'li esa jismning aynan n - sekundda bosib o'tgan masofasi, xolos! Buni biz n -sekundda bosib o'tilgan yo'l deymiz va quyidagi formula orqali topamiz:

Yechilishi: Tekis o'zgaruvchan harakatda jismning bosib o'tgan yo'li quyidagicha topiladi:

$$S = v_{o\cdot rt} \cdot t \quad (1)$$

Tekis o'zgaruvchan harakatda o'rtacha tezlikni topish uchun quyidagi ifoda har doim o'rinli:

$$v_{o\cdot rt} = \frac{v + v_0}{2} \quad (2)$$

$a = \frac{v - v_0}{t}$ ushbu formuladan t ni topsak, quyidagicha bo'ladi:

$$t = \frac{v - v_0}{a} \quad (3)$$

To‘g‘ri chiziqli tekis tezlanuvchan harakatda tezlik vektorining «moduli tekis oshib, yo‘nalishi o‘zgarmay qoladi».

Javob: B) moduli tekis oshib, yo‘nalishi o‘zgarmay qoladi.

6.31. Avtomobil tekis tezlanuvchan harakat boshlab, 5 s da 25 m yo‘l bosgan bo‘lsa, u 100 m masofani qancha vaqtida bosib o‘tadi?

- A) 20 s
- B) 10 s
- C) 7 s
- D) 15 s

Berilgan:

$$S = 25 \text{ m}$$

$$t = 5 \text{ s}$$

$$S_1 = 100 \text{ m}$$

$$t_1 = ?$$

Yechilishi: Bu masalani yechishda jism bir xil tezlanish bilan harakat qilganiga e’tiborimizni qaratamiz! Jism S_1 , masofani qancha vaqtida bosib o‘tganini bilishimiz uchun jismning qanday tezlanish bilan harakatlanganini bilishimiz kerak va biz bu tezlanishni jism S masofani bosib o‘tish uchun t vaqt sarflaganligidan topib olamiz.

Tekis o‘zgaruvchan harakatda jismning bosib o‘tgan yo‘li quyidagicha topiladi:

$$S = v_{0\cdot rt} \cdot t \quad (1)$$

Tekis o‘zgaruvchan harakatda o‘rtacha tezlikni topish uchun quyidagi ifoda har doim o‘rinli:

$$v_{0\cdot rt} = \frac{v + v_0}{2} \quad (2)$$

Bu ifodadan foydalanib (1) ifodani quyidagicha yozishimiz mumkin:

$$S = \frac{v + v_0}{2} \cdot t \quad (3)$$

$a = \frac{v - v_0}{t}$ ushbu formuladan v ni topsak, quyidagicha bo‘ladi:

$$v = v_0 + at \quad (4)$$

(4) ifodani (3) ifodaga qo‘ysak, quyidagi ifoda hosil bo‘ladi va biz undan jismning qancha masofani bosib o‘tganini topamiz:

$$S = \frac{v_0 + at + v_0}{2} \cdot t = \frac{2v_0 t + at^2}{2} = v_0 t + \frac{at^2}{2}$$

$$S = v_0 t + \frac{at^2}{2} \quad (5)$$

Jism boshlang'ich tezliksiz harakatlanayotgani uchun (5) ifodani quyidagicha yozamiz va undan jismning qanday tezlanish bilan harakatlanganini topib olamiz:

$$S = \frac{at^2}{2} \Rightarrow a = \frac{2S}{t^2}$$

Jismning qanday tezlanish bilan harakatlangani endi bizga ma'lum va endi biz jism S_1 masofani qancha vaqtda bosib o'tishini topamiz!

$$S_1 = \frac{at_1^2}{2} \Rightarrow t_1 = \sqrt{\frac{2S_1}{a}} = \sqrt{\frac{S_1 \cdot t^2}{S}} = 10s$$

Javob: B) 10 s.

6.32. Ikkita avtomobilning harakat tenglamalari $x_1 = 2t^2 + 4t$ va $x_2 = 8t + 6$ ko'rinishga ega. Ular qayerda va qachon uchrashadi?

- | | |
|--------------------------|--------------------------|
| A) $x = 30$ m, $t = 3$ s | B) $x = 18$ m, $t = 3$ s |
| C) $x = 16$ m, $t = 4$ s | D) $x = 48$ m, $t = 6$ s |

Berilgan:

$$\left| \begin{array}{l} x_1 = 2t^2 + 4t \\ x_2 = 8t + 6 \\ x = ? \quad t = ? \end{array} \right.$$

Yechilishi: Mashinalar uchrashishi uchun bir joyga kelishi kerak. Bir joyga kelganlarida esa ularning koordinatalari teng bo'ladi, ya'ni: $x_1 = x_2$

Ularning koordinata tenglamalarini tenglashtiramiz:

$$2t^2 + 4t = 8t + 6$$

$$2t^2 - 4t - 6 = 0$$

Ushbu kvadrat tenglamani yechsak, mashinalar $t = 3$ s dan keyin uchrashgani ma'lum bo'ladi. Endi bu vaqtini koordinata tenglamalariga qo'ysak, qayerda uchrashishlari kelib chiqadi:

$$\left| \begin{array}{l} x_1 = 2t^2 + 4t = 2 \cdot 3^2 + 4 \cdot 3 = 30 \text{ m} \\ x_2 = 8t + 6 = 8 \cdot 3 + 6 = 30 \text{ m} \end{array} \right.$$

Demak, avtomobillar $t = 3$ s dan keyin $x = 30$ m koordinatada uchrashar ekan!

Javob: A) $x = 30$ m, $t = 3$ s.

- A) 0,4 B) 0,2 C) 2 D) 4

Berilgan:

$$S = 2t^2$$

$$a = ?$$

Yechilishi: Tekis o'zgaruvchan harakatda jism bosib o'tgan yo'lning vaqtga bog'lanish tenglamasining asl ko'rinishi quyidagicha:

$$a = \frac{v - v_0}{t} \quad (1)$$

(1) Ifodadan jism tezligining o'zgarish vaqtini topamiz, jism tekis sekinlanuvchan harakat qilgani uchun tezlanish manfiy qiymat oladi:

$$t = \frac{v - v_0}{-a} = \frac{\frac{v_0}{2} - v_0}{-a} = \frac{v_0}{2a}$$

Javob: B) $\frac{v_0}{2a}$.

A) 0,5

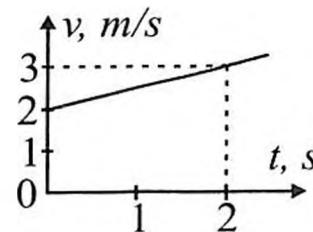

B) 1

C) 1,5

D) 2

Tezlanish, bu — jism tezligining vaqt birligi ichida o'zgarishidir:

$$a = \frac{v - v_0}{t}$$

Grafikdan foydalanib jismning tezlanishini topishimiz uchun, kerakli kattaliklarni bilib olamiz:

1. Jismning boshlang'ich tezligi: $v_0 = 2 \text{ m/s}$.
2. Jism $t = 2 \text{ s}$ da o'z tezligini $v = 3 \text{ m/s}$ gacha oshirgan.

$$a = \frac{3 - 2}{2} = 0,5 \text{ m/s}^2$$

Javob: A) 0,5.

Berilgan:

$$\begin{array}{l|l} S = 9 \text{ m} & \\ n = 2 & \\ \hline a = ? & \end{array}$$

Yechilishi: Avtomobilning n sekundda bosib o'tgan yo'li bilan n sekundda bosib o'tgan yo'lining farqi bor. Avtomobilning n sekundda bosib o'tgan yo'li bu: jismning 1, 2 va... n -sekundlarda bosib o'tgan yo'llar yig'indisi yoki harakat boshlanganidan to n sekund o'tganicha bosib o'tgan masofasidir. Jismning n - sekundda bosib o'tgan yo'li esa jismning aynan n - sekundida bosib o'tgan masofasi, xolos! Buni biz n -sekundda bosib o'tilgan yo'l deymiz va quyidagi formula orqali topamiz:

$$S_n = v_0 + \frac{a}{2}(2n - 1) \quad (1)$$

Mashina boshlang'ich tezliksiz harakatlanayotgani uchun (1) ifodani quyida gicha yozish mumkin:

$$S_n = \frac{a}{2}(2n - 1) \quad (2)$$

(2) ifodadan a ni topamiz:

$$a = \frac{2S_n}{2n - 1} = \frac{2 \cdot 9}{2 \cdot 2 - 1} = 6 \text{ m/s}^2$$

Javob: D) 6.

6.37. Harakat boshlangandan keyin jismning 8 sekundda bosib o'tgan yo'li 3 sekundda bosib o'tgan yo'lidan 3 marta katta bo'lsa, u qanday tezlanish bilan harakatlangan (m/s^2)?

- A) 1 B) 2 C) 3

Jismning n -sekundda bosib o'tgan yo'li esa jismning aynan n - sekundda bosib o'tgan masofasi, xolos! Buni biz n -sekundda bosib o'tilgan yo'l deymiz va quyidagi formula orqali topamiz:

$$S_n = v_0 + \frac{a}{2}(2n - 1) \quad (1)$$

Jism boshlang'ich tezliksiz harakatlanayotgani uchun (1) ifodani quyidagicha yozishimiz mumkin:

$$S_n = \frac{a}{2}(2n - 1) \quad (2)$$

Endi jismning 8-sekundda bosib o'tgan yo'lining 3-sekundda bosib o'tgan yo'liga nisbatini olamiz:

$$\frac{S_8}{S_3} = \frac{\frac{a}{2}(2n_1 - 1)}{\frac{a}{2}(2n_2 - 1)} = \frac{(2n_1 - 1)}{(2n_2 - 1)}$$

Ko'rib turganingizdek, har ikkala ifodada jism tezlanishi qisqarib ketdi. Demak, tezlanishning har qanday qiymatida jismning 8-sekundda bosib o'tgan yo'li 3-sekundda bosib o'tgan yo'ldan 3 marta katta bo'lar ekan:

7.43. Jism h balandlikdan erkin tushmoqda. Uning yo'lning ikkinchi yarmidagi o'rtacha tezligi qanday?

A) $\sqrt{gh(\sqrt{2} - 1)}$; B) $\frac{\sqrt{gh}(\sqrt{2} - 1)}{2}$; C) $\frac{\sqrt{gh}(\sqrt{2} + 1)}{2}$; D) $\frac{\sqrt{gh}(\sqrt{2} + 1)}{4}$.

Berilgan:

$$v_0 = 0$$

$$g = 10 \text{ m/s}^2$$

$$v_{o'rt} = ?$$

Yechilishi: O'rtacha tezlik umumiy yo'lning (S_u) umumiy vaqtga (t_u) nisbatiga teng.

$$v_{o'rt} = \frac{S_u}{t_u}; S = \frac{h}{2}$$

Jism tushish balandligining 2-yarmini bosib o'tish uchun ketgan vaqtini aniqlaymiz:

$$t = \sqrt{\frac{2h}{g}} \Rightarrow \text{umumiy vaqt}$$

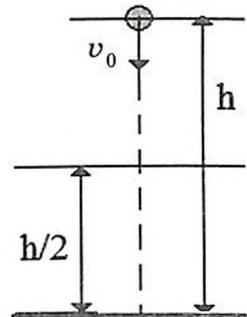

$$t_1 = \sqrt{\frac{2h}{g}} \Rightarrow 1 \text{ yarmini bosib o'tish uchun ketgan vaqt}$$

$$t_u = t - t_1 \Rightarrow \text{balandlikning ikkinchi yarmini bosib o'tish uchun ketgan vaqt}$$

$$t_u = \sqrt{\frac{2h}{g}} - \sqrt{\frac{h}{g}} = \sqrt{\frac{h}{g}}(\sqrt{2} - 1)$$

$$v_{o'rt} = \frac{h}{2} \cdot \sqrt{\frac{g}{h}} \cdot \frac{1}{\sqrt{2} - 1} = \frac{\sqrt{gh}}{2(\sqrt{2} - 1)} = \frac{\sqrt{gh}(\sqrt{2} + 1)}{2(\sqrt{2} - 1)(\sqrt{2} + 1)} = \frac{\sqrt{gh}(\sqrt{2} + 1)}{2}$$

Javob: C) $\frac{\sqrt{gh}(\sqrt{2} + 1)}{2}$.

7.44. Vertolyot 500 m balandlikdan o'zgarmas 10 m/s tezlik bilan tusha boshlagan paytda undan biror jism tashlandi. Jism vertolyotdan necha sekund oldin tushadi?

- A) 50 B) 25 C) 38 D) 4

Berilgan:

$$v_0 = 10 \text{ m/s.}$$

$$h = 500 \text{ m}$$

$$\Delta t = ?$$

Yechilishi: Vertolyot tekis harakat qilib t_1 vaqtdan keyin yerga tushadi.

$$t_1 = \frac{h}{v_0} = 50 \text{ s}$$

Tosh esa vertolyotning v_0 tezligini oladi va vertikal pastga otilgan jism kabi harakatlanadi.

$$h = v_0 t_2 + \frac{gt_2^2}{2} \Rightarrow 500 = 10t_2 + 5t_2^2 \Rightarrow t_2^2 + 2t_2 - 100 = 0$$

$$t_2 = 9 \text{ s}; \quad \Delta t = t_1 - t_2 = 41 \text{ s}$$

Javob: E) 41.

- A) 16 B) 32 C) 160 D) 320

$$v = 320 \text{ m/s}$$

$$h = ?$$

Yechilishi: Toshning tushish vaqtি

$$t_1 = \sqrt{\frac{2h}{g}}$$

Tovush havoda v tezlik bilan harakatlangani uchun uning shaxtadan

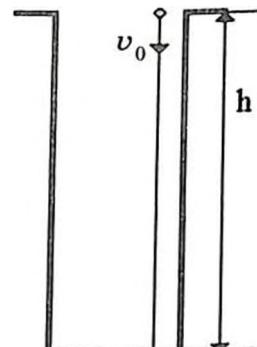

$$\text{chiqish vaqtি } t_2 = \frac{h}{v}$$

$$\text{Umumiy vaqt } t = t_1 + t_2$$

$$t = \sqrt{\frac{2h}{g}} + \frac{h}{v} \Rightarrow t - \frac{h}{v} = \sqrt{\frac{2h}{g}}$$

$$(vt - h)^2 = \left(v\sqrt{\frac{2h}{g}}\right)^2 \Rightarrow (vt)^2 - 2vth + h^2 = \frac{2v^2h}{g}$$

$$h^2 - \left(2vt + \frac{2v^2}{g}\right)h + (vt)^2 = 0$$

$$h^2 - \left(2 \cdot 320 \cdot 9 + \frac{2 \cdot 320^2}{10}\right)h + (320 \cdot 9)^2 = 0$$

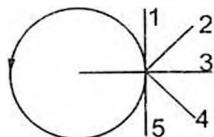

$$h^2 - 26240h + 829400 = 0$$

$$v_0 = gt \Rightarrow t = \frac{v_0}{g}$$

$$t_1 = \frac{v_{01}}{g}, \quad t_2 = \frac{v_{02}}{g} \Rightarrow \frac{t_1}{t_2} = \frac{v_{02}}{g} \cdot \frac{g}{v_{01}} = \frac{2v_{01}}{v_{01}} = 2$$

Berilgan:

$$t = 3,14 \text{ s}$$

$$R = 2 \text{ m}$$

$$S = \frac{l}{2}$$

$$v = ?$$

Yechilishi: tekis harakatda bosib o'tilgan yo'l $S = v \cdot t$ ifodadan aniqlanadi. Masala shartiga ko'ra $S = l/2$ ga teng. Demak,

B) $v = v_0 - gt$

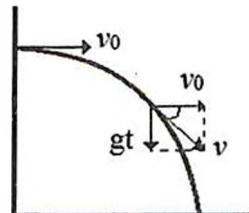

C) $v = gt$

D) $v = \sqrt{v_0^2 + (gt)^2}$

gorizontal tezligi uning gorizontga otilish tezligiga, ya'ni v_0 ga teng. Vertikal yonalishdagi tezlik esa vaqt o'tishi bilan ortib boruvchi $v_y = gt$ tezlikka ega va bu tezliklar bir-biriga 90° burchak ostida yo'nalgani uchun, gorizontga otilgan jismning oniy tezligini Pifagor teoremasi orqali topamiz.

 $v = ?$

Yechilishi: h balandlikdan otilgan jismning borib tushgan joyiga boshqa bir jismni $h/2$ balandlikdan ortib tushirish uchun uni kattaroq tezlik bilan otish kerak. Biz bu masalada ikkala balandlikdan otilgan jismlarning ham uchish uzoqliklari bir xil ekanini bilgan holda, ikkinchi jismni qanday tezlik bilan otsak, birinchi jismning yoniga tushishini bilib olamiz.

Birinchi jismning uchish uzoqligi $S = v_0 \cdot \sqrt{\frac{2h}{g}}$ ifoda bilan topiladi. Ikkinci jismning uchish uzoqligi esa $S = v \cdot \sqrt{\frac{2 \cdot \frac{h}{2}}{g}}$ ifoda bilan topiladi. Ikkala ifoda bir-biriga teng.

Bundan foydalanib quyidagi natijani olamiz:

- C) jismlarning o'zaro ta'sirini faqat yo'nalish jihatdan xarakterlaydigan kattalikka

Kuch — vektor kattalik bo'lib, jismga boshqa jismlar va maydonlar tomonidan ko'rsatilayotgan mexanik ta'sirming o'chovi hisoblanadi. Bu ta'sir natijasida jism tezlanish olishi, o'zining shakli yoki o'chamlarini o'zgartirishi mumkin.

13.2. Quyidagilarning qaysi biri Nyutonning birinchi qonuniga zid emas?

- A) agar jismga tashqi kuchlar ta'siri o'zaro muvozanatlashgan bo'lsa, u boshqa har qanday jismga nisbatan o'zining to'g'ri chiziqli tekis harakatini saqlaydi
- B) tashqi kuchlar ta'sir etmaydigan jism boshqa har qanday jismlarga nisbatan to'g'ri chiziqli tekis harakat holatini saqlaydi
- C) tashqi ta'sirlar o'zaro muvozanatlashgan yoki tashqi kuchlar ta'sir etmaydigan jismlar bir-birlariga nisbatan hamisha to'g'ri chiziqli tekis harakat qildilar

$$\Delta U_2 = \frac{i}{2} \frac{m}{M} R \Delta T_2 = \frac{i}{2} P_2 \Delta V_2 = \frac{i}{2} 2PV = iPV; \quad A_2 = P_2 \Delta V_2 = 2PV$$

$$Q_2 = \Delta U_2 + A_2 = iPV + 2PV$$

$$\eta = \frac{A}{Q_{um}} \cdot 100\% = \frac{A}{Q_1+Q_2} \cdot 100\% = \frac{PV}{Q_1+Q_2} \cdot 100\% = \frac{PV}{\frac{1}{2}PV+iPV+2PV} \cdot 100\% = \\ = \frac{PV}{\left(\frac{i}{2}+i+2\right)PV}.$$

$$100\% = \frac{1}{\frac{i+2i+2}{2}} \cdot 100\% = \frac{2}{i+2i+4} \cdot 100\% = \frac{2}{3+2 \cdot 3+4} \cdot 100\% = \frac{2}{13} \cdot 100\% = 15,4\%$$

Javob: B) $\eta = 15,4\%$.
